## About the Course

Myopain Seminars is pleased to present a unique Advanced Dry Needling Dissection course at the Institute for Anatomical Research in Colorado Springs, CO. Course instructors are Drs. Jan Dommerholt and Jim Pulciani from the Institute for Anatomical Research.

The course will combine an indepth review of challenging dry needling techniques combined with detailed clinical anatomical studies presented in the context of dry needling. We will challenge common belief systems about anatomy, i.e., is it possible to differentiate the serratus posterior superior muscle and the rhomboid muscles, considering that Travell and Simons described distinctively different referred pain patterns?

How about the pyramidalis muscle in relation to the rectus abdominis muscle? What is the correct dry needling approach for the multifidus muscles? We will explore the relationship between muscles and fascia in different areas of the body, and various fascial and scar tissue needling techniques.

The Institute for Anatomical Research is focused on inspiring the development of advanced therapies and treatment options to improve the quality of life through the study of anatomy from real cadavers. During the course, specific portion of cadavers will be dissected again in the context of dry needling.

Group size will be limited to 20 students.

**This course has immediate clinical applicability,  
improved understanding of the importance of  
anatomy in daily practice!**
